

ARTIFICIAL TURF

CLEANING AND CARE

Artificial turf surfaces, filled with sand or sand/rubber granulate are constantly exposed to environmental influences such as pollen, dust and leaves. Due to heavy use and lack of maintenance, the infill material compacts, causing the surface to harden and impairing the drainage effect.

In addition, the risk of slipping increases due to the formation of weeds, algae and moss. Further accident risks for sportsmen and women due to contamination such as broken glass, chewing gum, cigarette butts, residual waste, and much more.

Due to our high quality standard we are certified with the RAL quality mark.

AREAS OF APPLICATION

Soccer fields

5-a-side football fields

Tennis courts

Hockey fields

Stadiums

Multipurpose sport court

SERVICE AND REPAIR

Damage in the flooring due to environmental influences, vandalism, improper use, wear, etc. can also adversely affect its use in relation to the public law duty to maintain public safety. SANDMASTER does this for you professionally and reliably:

- Exchange of penalty points
- Glue on seams & rulings
- Measurement of the filling level
- Exchange of small parts
- Refilling with sand / granules
- Creation of status reports & maintenance plans

YOUR ADVANTAGES: Extension of service life; Lifting of the grass fibre (as far as possible); Measuring of infill material (systems with infill); Removal of weeds, algae, moss; Recognition of and report on damaged areas in the turf; Considerable reduction of granulate loss due to brushing-in; Drawing up of maintenance schedules; Certified according to RAL-GZ 944/6.
